

SOUND CASE - Instructions & Troubleshooting

Thank you for your purchase of a Sound Case from Tumbi Trak.

The Sound case has been specifically designed to reduce noise from a constant flow blower. It features reinforced corners and handles, strong body, locking wheels, and an opening for the nozzle of the blower. The inside of the Sound Case is lined with noise reduction foam. The bottom is open for air flow into the blower. The Sound Case comes with a 2 year warranty.

SETTING UP THE SOUND CASE:

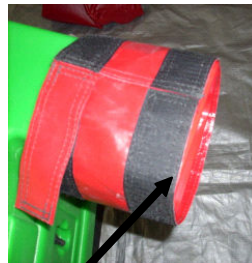

1. ATTACH THE EXTENSION PIECE TO THE BLOWER NOZZLE

Extension Piece

Over the nozzle.

Line up end.

Take out the slack by pinching up the vinyl.

Pull the flap tight.

2. TURN BLOWER SIDWAYS / LOWER BLOWER INTO CASE / ATTACH AIR TUBE

Run the cord of the blower down through the bottom.

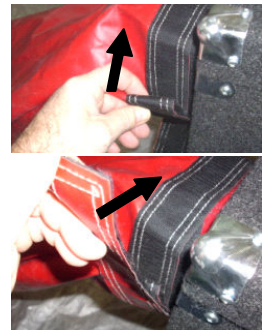

Put blower **ON ITS SIDE** and lower into the sound case.

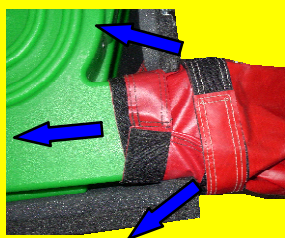

Make sure the nozzle extends out the nozzle opening.

Pinch the extension piece and attach the air tube around the nozzle.

Pinch the air tube and pull the flap tight.

TROUBLESHOOTING

After attaching the air tube and turning on the blower you will notice that there will be some air flowing out of the extension piece and air tube. This is normal. However, to reduce the amount of air flowing out make sure that the extension piece and air tube are on as tight as possible by pinching and pulling the flaps tight as shown above. Also make sure the air tube (from the blower to the inflatable) is not twisted.

The Extension Piece allows you to attach / unattach the air tube without opening the case. Turn the blower on / off by opening the lid and reaching in, or plug / unplug the power cord.
